WHAT IS CLAIMED IS:

1.   A falsification preventing apparatus comprising:

an open recording region storing a page opened on the Internet;

a backup recording region storing backup information on information stored in said open recording region;

monitoring means for detecting a write instruction with respect to said open recording region; and

copy means for copying the backup information stored in said backup recording region to said open recording region when said monitoring means detects the write instruction with respect to said open recording region.

2.   A falsification preventing apparatus according to claim 1, wherein

said falsification preventing apparatus further comprises an update recording region for updating the information stored in said open recording region; and

said copy means copies the information stored in said update recording region to said open recording region and said backup recording region when the information stored in said update recording region is updated.

3.   A falsification preventing apparatus according to claim 2, further comprising:

authentication means for executing authentication of a user when the information stored in said update recording region is updated.

4.   A falsification preventing method comprising the steps

of:

    detecting a write instruction with respect to an open
recording region storing a page opened on the Internet; and

    reading backup information on information stored in said
open recording region from a backup recording region storing
said backup information, and copying said backup information
to said open recording region when the write instruction with
respect to said open recording region is detected.

5.   A falsification preventing method according to claim 4,
further comprising the step of:

    allowing the information in said open recording region
and said backup recording region to be updated when the
authentication of the user is executed.

6.   A computer readable recording medium recording a program
for making a computer execute:

    a processing for detecting a write instruction with
respect to an open recording region storing a page opened on
the Internet; and

    a processing for reading backup information on
information stored in said open recording region from a backup
recording region storing said backup information and copying
said backup information to said open recording region when the
write instruction with respect to said open recording region
is detected.

7.   A recording medium according to claim 6, wherein
    said program further makes the computer execute a
processing for allowing the information in said open recording

region and said backup recording region to be updated when authentication of user is executed.
